7.1	Steering damper	70 - 72
7.2	Hub caps with integrated mechanical odometer	74
7.3	Hub caps with integrated digital odometer (ECOMETER)	75
7.4	Special tools for BPW ECO Disc disc brakes	77 - 80

Valid: 01/12/2019

This list shows original spare parts for BPW trailer axles and steering axles in the series **SR.. / SKR.. 9 t** from 2019 and **SH.. / SK.. 8 - 12 t** from 2010 onwards.

For additional spare parts, see the spare parts catalogues.

Current versions and additional information can be found online at: www.bpw.de.

Subject to change without notice.

Parts marked with a  in the drawings are provided with a BPW item number.

BPW type plate

	Example:
The BPW type name is composed of a letter group and a number group.	SRBF 9010 ECO-P
The letter group identifies the type of axle and suspension version and also defines the hub version.	SRBF - BPW axle version SR with B -hub (with offset), wheel studs M 22 x 1.5, without wheel nuts
The number group specifies the axle load on the ground in kilogrammes and the number of wheel studs per wheel hub (for disc wheel connection).	9010 - 9000 kg axle load - 10 wheel studs per wheel hub
The group of letters at the end of the type designation defines the type of hub bearing.	ECO-P - ECO^{Plus} bearing generation
You can view the brake certificate (as of 10/2004 multiple entries possible) referenced by certificate type/ test report number on the type plate by logging onto the BPW website at https://www.bpw.de/en/service/downloads (BPW Braking Systems under Filters / Sector / Test report).	e.g. D116/.../36103516 - D116 Certificate type - 36103516 Test report no.

1 Axle beams, steering axle beams

General

Determining replacement axle beams

The BPW axle code number is shown on the type plate. If this is missing or no longer legible, the BPW axle number can be read off the front end of the axle stub in most cases.

When ordering a replacement, quote this BPW axle number with the reference to a replacement axle beam.

In steering axles and ECO Plus 2 bearings, no item number is stamped on the front end of the stub.

From June 2012, the axle beam welding number will now be stamped onto the front of the axle stub.

If there is no BPW axle number or none is known, BPW can identify the axle based on the axle beam welding number (see also BPW Internet application for spare part lists for commercial vehicles) or the dimensions.

1. **Axle beam cross section** (□ 120/150 or Ø 146)
2. **Axle beam wall thickness** (if known)
3. **Spring centre (FM)**
4. **Track (SP)**
5. **Overall width (P)**
6. **Leaf spring width**
7. **Spring pad hole pattern** (if present)
8. **Wheel seat (H)**
9. **Reference diameter and number of wheel studs (K)**
10. **For steering axles steering pivot centre**

In addition, the **type of tyres**, the **wheel size** and the **brake size** should also be specified, as well as the approximate **year of manufacture** (date of registration).

2 Steering axle, steering stabiliser

General

BPW steering axles, LL series

No one wants tyres that lose rubber every time they turn a corner. We have therefore developed an axle which allows your wheels to roll instead of slide.

The **BPW-Tag axle LL**.

The enormous advantages of the steering axle come to the fore when manoeuvring: Better manoeuvrability, reduced wear on all tyres and less fuel consumption.

For delivery and distribution traffic, primarily in dense conurbations and cities, the BPW-Tag axle is therefore the right economic solution.

How it works

LL stands for **load-dependent steering stabilisation** and it describes the unique, patented functional principle of the BPW-Tag axle.

Conventional steering axle designs require steering stabilisers powered from an external source - this is not the case with the BPW-Tag axle. The axle beam and axle stub are connected to undulating thrust bearings via steering pivots.

When driving straight ahead (0 position), the undulations in the thrust washers keep the wheels on track. The vehicle weight presses the shaft contours of the upper and lower thrust washers together. The wheels remain stable in the correct straight-ahead position.

If the semi-trailer follows the tractor unit into a curve, the caster ensures that the wheels turn in accordance with the curve radius (the thrust washers slide over each other).

The frictional resistance changes depending on the load on the axle. As a result, a steering angle (8° to 27°, depending on the axle type) is achieved according to the load, and is entirely controlled by mechanical means.

The drag link connecting the wheels uses a steering lock to prevent the wheels from steering when the vehicle is reversing.

Steering axle, steering stabiliser 2

General

The effect of the steering axle is that the suspension unit steers into a curve better and almost precisely follows the circular path of the tractor unit.

The lateral forces on the tyres are optimally distributed among all the axles, for example in the case of a three-axle trailer.

Because each axle experiences considerably lower lateral forces, the performance of the tyres is demonstrably increased by up to 50 % on the front axle – and up to 70 % on the rear axle.

The use of the BPW steering axle produces absolutely even wear.

3 BPW ECO Disc brake parts

3.1 General (TS2/TSB)

Brakes that are under-utilised can glaze up and reduce the braking effect. Brakes that overheat have disproportionate wear.

Correct dimensioning of the brake is therefore of crucial significance. BPW offers you the correct brake for every application.

BPW ECO Disc disc brakes (TS2/TSB) 3709 (Ø 370)

For versatile deployment in the haulage business under normal conditions (e.g. long-distance road haulage in Western Europe).

Axle load:	9 – 10 t
Tyre size:	19.5" (9 + 10 t) 22.5" (9 t)
Wheel type:	E, Z, ET 0 ET 120 (9 t only)

BPW ECO Disc disc brakes (TS2/TSB) 4309 (Ø 430)

For conditions that demand greater disc and lining volume, such as mountainous routes, frequently changing tractor-trailer combinations, deployment in Eastern Europe or in regional distribution.

Axle load:	9 – 10 t
Tyre size:	22.5"
Wheel type:	E, Z, ET 0; ET 120 (9 t only)

Advantage: Large brake disc diameter with brake actuating unit matching the axle load.

BPW ECO Disc disc brake (TSB) 4312 (Ø 430)

For axle loads above 10 t.

Axle load:	11 – 12 t
Tyre size:	22.5"
Wheel type:	E, Z, ET 0

E = Single wheels

Z = Twin wheels

ET = Offset

BPW ECO Disc brake parts 3

General (TS2/TSB) 3.1

Type plate

There is a manufacturer's nameplate fixed onto each brake caliper, on which the data is stamped that is necessary to identify the respective brake.

3 BPW ECO Disc brake parts

3.2 Functional principle (TS2)

BPW ECO Disc brake discs TS2 3709 / 4309

FUNCTIONAL PRINCIPLE: SLIDING CALIPER BRAKE (TS2)

APPLYING THE BRAKE

During braking, the push rod of the spring brake or diaphragm cylinder presses onto the brake lever (1). The offset position of the brake lever amplifies the force of the brake cylinder and allows it to be transferred to the traverse (3) with low losses via a needle bearing (2).

The clamping force acts on the inner brake lining (5a) via the traverse (3) and the threaded sleeve (4).

Once the clearance between the inner brake lining and the brake disc (6) has been overcome, the reaction force is transferred to the outer brake lining (5b) via the brake caliper.

The braking moment for the wheel results from the contact pressure of the brake linings on the brake disc.

The radial stabilizer force created by the responding brake lining at this time is transferred directly to the axle via the brake calliper.

RELEASING THE BRAKE

When brake pressure decreases, the pressure spring (7) moves the actuating unit back to its initial position.

ADJUSTMENT

The brake is fitted with an automatic non-wearing adjusting device to maintain constant clearance between the brake linings and the brake disc.

Each brake application also simultaneously actuates the adjustment hub (9), which is coupled with the brake actuating unit via a shift sleeve (10), via an adjustment pin (8) in the brake lever. A reset shaft (11) with toothed washer (12) connected to the shift sleeve defines the clearance of the disc brake via the tooth pitch.

When the clearance increases due to brake lining and brake disc wear, the threaded sleeve (4) is turned by the degree of wear through adjustment via a wrap spring (13).

When the clearance is correctly set, the wrap spring slides through without turning the threaded sleeve.

The overall clearance (total clearance on both sides of the brake disc) measures 0.7 – 1.3 mm.

RESET

The disc brake features a reset mechanism at the back for replacing the brake linings and brake disc.

To reset the threaded sleeve (4) to its initial position, the reset shaft equipped with a hexagon connection (14) is moved back using a slight torque, or the clearance of the brake is preset.

BRAKE CYLINDER

Air pressure builds up behind the diaphragm due to the action of compressed air on the brake cylinder.

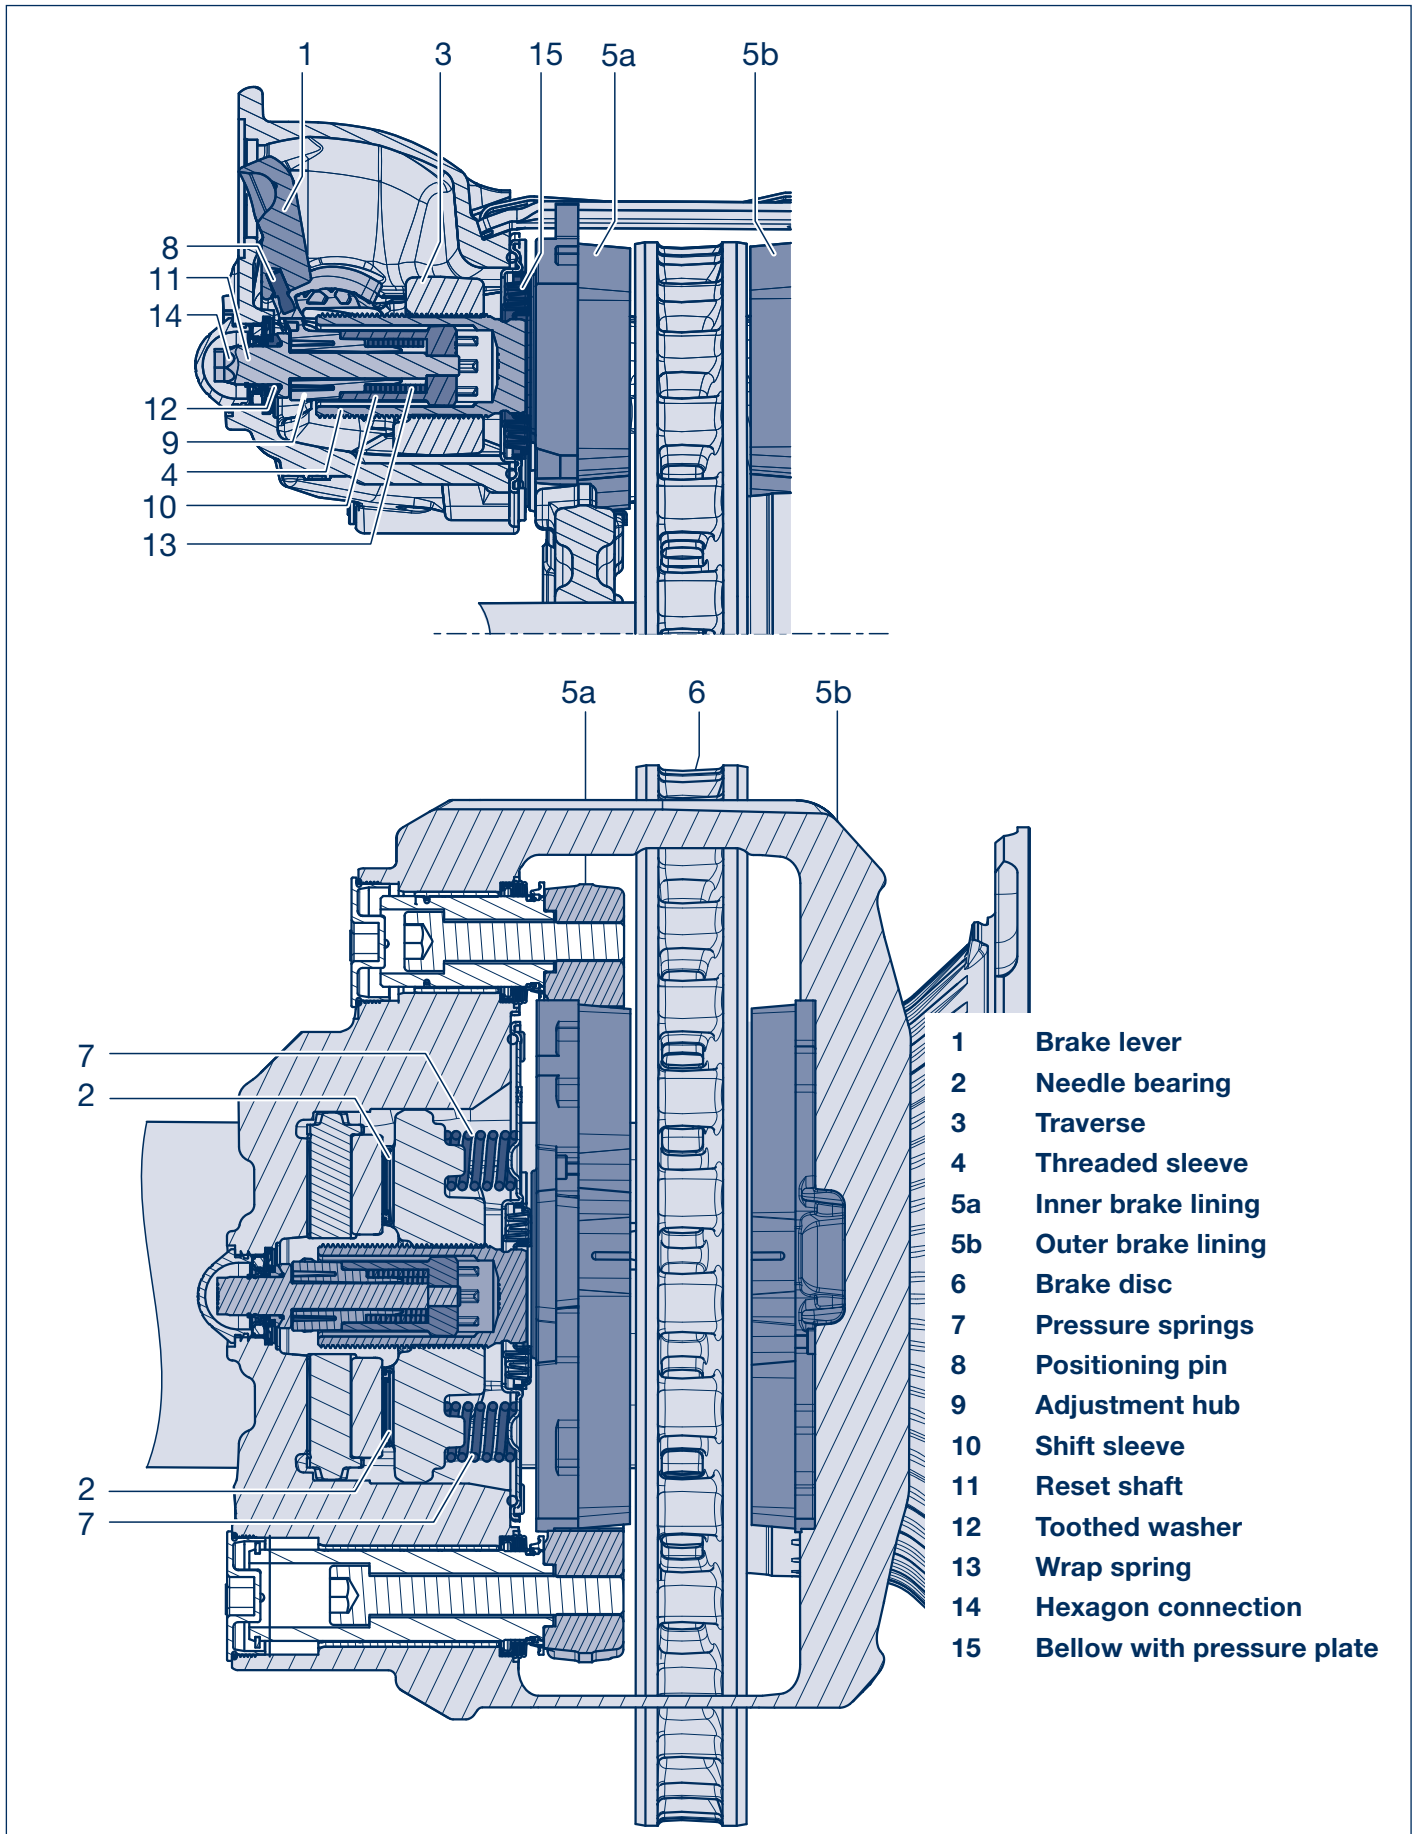

Air pressure forces the thrust rod out of the cylinder via the diaphragm plate.

The brakes may only be fitted with brake cylinders which are fitted with a so-called "inner sealing", apart from the sealing of the flange surface.

This means that the push rod acting on the lever (1) must be hermetically sealed from the secondary chamber of the brake cylinder, as otherwise the clamping mechanism is completely open to its surroundings.

3 BPW ECO Disc brake parts

3.5 Functional principle (TSB)

BPW ECO Disc disc brakes TSB 3709 / 4309 / 4312

FUNCTIONAL PRINCIPLE: SLIDING CALIPER BRAKE (TSB)

APPLYING THE BRAKE

During braking, the push rod of the spring brake or diaphragm cylinder presses onto the brake lever (1). The offset position of the brake lever amplifies the force created by the brake cylinder and allows it to be transferred to the pressure plate (4) with minimal loss via a needle bearing (3).

The clamping force acts on the inner brake lining (7a) via the transverse (5) and the tappets (6).

Once the clearance between the inner brake lining and the brake disc (8) has been overcome, the reaction force is transferred to the outer brake lining (7b) via the brake caliper.

The braking moment for the wheel results from the contact pressure of the brake linings on the brake disc.

The radial stabilizer force created by the responding brake lining at this time is transferred directly to the axle via the brake calliper.

RELEASING THE BRAKE

When brake pressure decreases, the pressure spring (9) moves the actuating unit back to its initial position.

ADJUSTMENT

The brake is fitted with an automatic non-wearing adjusting device (10) to maintain a constant clearance between the brake linings and the brake disc.

Each brake application simultaneously activates the adjuster pin (11), which is coupled with the brake actuating unit via a movement thread (11a). The axial clearance of the trapezoidal thread determines the clearance value of the disc brake.

When the clearance increases due to brake lining and brake disc wear, the threaded tube (14) is turned by the degree of wear through adjustment via a ball joint (12).

When the clearance is correctly set, the ball joint moves out without turning the threaded tube.

The overall clearance (total clearance on both sides of the brake disc) measures 0.7 – 1.3 mm.

RESET

The disc brake features a reset mechanism at the front for replacing the brake pads and brake disc.

The return spring gear wheel (13) is mechanically connected to the external gearing of the threaded tube (14) so that the tappets (6) can return to their initial position. Only minimal torque is required to move the tappets (6) back to their initial position or preset the clearance.

BRAKE CYLINDER

Air pressure builds up behind the diaphragm due to the action of compressed air on the brake cylinder.

Air pressure forces the thrust rod out of the cylinder via the diaphragm plate.

The brakes may only be fitted with brake cylinders which are fitted with a so-called "inner sealing", apart from the sealing of the flange surface.

This means that the push rod acting on the lever (1) must be hermetically sealed from the secondary chamber of the brake cylinder, as otherwise the clamping mechanism is completely open to its surroundings.

3 BPW ECO Disc brake parts

3.8 Brake discs (TS2/TSB)

General

BPW brake discs

With the introduction of IBD brake discs (IBD = Internal ventilation/permanent brake), the tried and proven BPW design of the collar disc has been further improved.

Further development has focused on the regulation of thermal efficiency in order to optimise wear characteristics and to increase reliability.

The quality of brake discs is the result of a combination of the shape of the design, the materials used and the quality of the mechanical machining.

The chemical composition of the material alloy is in particular responsible for a large number of properties, and hence determines some essential product features.

BPW has taken these technological influences into account for many years in the development of brake discs, matching them to the requirements on the trailer.

BPW brake disc - IBD version

Original BPW brake discs offer the following advantages:

- ⊙ Increased surface area for effective heat dissipation
- ⊙ Optimisation of material for improved heat distribution over the surface of the disc
- ⊙ Venturi contour for optimal internal air flow
- ⊙ Matched to the optimised BPW brake linings
- ⊙ High resistance to wear
- ⊙ Simplified spare parts supply thanks to uniform brake discs for 0 and 120 offsets

S = Single wheels ET 0
B = Single wheels ET 120
Z = Twin wheels

Wear status of the brake disc

The brake disc is to be regularly checked for its residual thickness and any damage to the braking surface.

The residual thickness of the brake disc must not be less than the permissible minimum in any area of the disc.

Network-like heat cracking (**A**), radial cracks up to 1.5 mm in width and depth (**B**) and pitting of the braking surface less than 1.5 mm (**C**) are permissible.

Continuous cracks (**D**) are not permissible.

If the brake disc has reached its wear limit or its braking surface shows inadmissible damage, it must be replaced.

Technical details:

- ⊙ Disc thickness, new = 45 mm
- ⊙ Minimum permissible disc thickness = 37 mm (check with slide gauge)

In the case of surface conditions as described for sections **A - C**, the brake disc can be used until the minimum permissible disc thickness has been reached.

3 BPW ECO Disc brake parts

3.9 Brake cylinder (TS2/TSB)

General

BPW Brake Cylinders

BPW brake cylinders come with a range of special features that prove their high quality level:

- ⦿ The cylinder size and the item number are permanently stamped
- ⦿ Parts which are critical to function can be traced back through the QA system by means of their type plate
- ⦿ Easy to install due to compressed air connection extension
- ⦿ Double seals on the twin compartment
- ⦿ Effective anti-corrosion protection through powder and Delta Tone coating
- ⦿ Shot peened and epoxy coated pressure springs
- ⦿ Undetachable spring chamber secured with a tight fit
- ⦿ Long life expectancy due to high-performance rubber diaphragms
- ⦿ Closely sealing bellow
- ⦿ Chromated alloy housing

Versions:

Cylinder

These act as a service brake and are characterised by their compact external dimensions and low weight.

Diaphragm-diaphragm (M-M) cylinders

These act both as a service brake – and an auxiliary and parking brake. They are lighter than the diaphragm-piston cylinder.

Diaphragm-piston (M-K) cylinders

These have the same function as a diaphragm-diaphragm cylinder. Their greater spring accumulator force means they are particularly suitable for vehicles with higher axle loads.

BPW ECO Disc brake parts 3

Brake cylinder (TS2/TSB) 3.9

General

Release device

As of March 2004 the release device for M-M brake cylinders on axles with disc brakes have had a new parking position.

The release device is no longer accommodated in the parking pocket on the outside of the cylinder but is left directly in the cylinder cover plate.

All that is needed to use the parking position is to turn the release device 90° and then lock it in place with a hexagon nut.

In addition, it is still also possible to remove the release device completely.

Release device inserted,
spring brake released

Release device in parking position,
plastic sleeve and split pin fitted

Compressed air connection extension (DLAV)

Spring-type cylinders for disc brakes are fitted with a compressed air connection extension (DLAV) as standard.

This allows fast and easy assembly on the compressed air system.

Identification

The BPW item number and the cylinder type are stamped on the front of every brake cylinder.

Each brake cylinder also has a type plate riveted onto it, with the details of the BPW item number, cylinder type and completion date.

3.10 BPW Brake Monitor

General

BPW Brake Monitor

With the BPW Brake Monitor supplementary installation kit for our disc brakes, you can check your vehicle from the outside at any time to see if the wear limit has been reached.

As soon as one of the brake linings has worn down by approx. 80 % the yellow "**Warning**" LED on the BPW Brake Monitor starts flashing.

Once the minimum pad thickness of 2 mm has been reached, the "**Service**" indicator changes to red, while the green and yellow LEDs flash alternately.

The red **SERVICE** indicator remains visible and indicates that the wear limit of at least one brake lining has been reached even if you have parked the vehicle and there is no electrical power supply to the trailer.

The brake linings should then be replaced as soon as possible.

BPW Brake Monitor – Features and benefits

- ⊙ Optimal use of the brake lining wear volume
- ⊙ Longer life expectancy for the brake discs and brake
- ⊙ No unscheduled downtime
- ⊙ No expensive follow-on costs (e.g. due to a complete failure)
- ⊙ The service indicator tells you exactly when a brake lining replacement is necessary, even if there is no operating voltage
- ⊙ Operates without a separate ECU and does not need EBS
- ⊙ Individual composition of kits possible because of modules (e.g. for four-axle vehicles)
- ⊙ Easy and fast assembly
- ⊙ Can easily be retrofitted
- ⊙ No technical inspection is required, since a general EU certification and hazchem approval have already been obtained
- ⊙ Can be connected to EBS for indication in motor vehicle

Warning:

At least one brake lining is approx. 80 % worn down!

Service:

At least one brake lining has reached the minimum lining thickness of approx. 2 mm.

Have the linings replaced immediately!

4 Hubs, hub bearings

General

BPW hub bearings

ECO^{Plus} bearing

If you require high performance, rapid maintenance and low maintenance costs from your axle, there is only one option for you: ECO^{Plus}.

On the basis of the special BPW ECO hub system, the ECO Unit has been further developed to create the trend-setting ECO^{Plus} bearing system.

The hub requires no maintenance and has an integrated multi-seal system to protect the roller bearings against dust and dirt.

A central bolt with integrated torque limiting function ensures the bearing preload is always optimal.

BPW ECO^{Plus} bearing – Features and benefits

- ⊙ The encapsulated bearing unit (ECO Unit) requires no maintenance and has an integrated multi-seal system to protect the roller bearings from dust and dirt
- ⊙ Integrated torque limiter in the axle nut (ECO^{Plus}) prevents wrong usage when tightening
- ⊙ Bearings are precisely re-adjusted after every disc replacement
- ⊙ 5+3 years ECO Plus warranty (on-road) without mileage limit
- ⊙ Compact bearing system with DIN-ISO roller bearings available worldwide for excellent availability and rapid service
- ⊙ Removal of the complete hub unit - thanks to central bolt - with simple tools
- ⊙ Excellent bearing service life with minimal life cycle costs

Fig. ECO^{Plus} (10 - 12 t)

Fig. ECO^{Plus} (10 - 12 t)

Hubs, hub bearings 4

General

BPW ECO Plus 2 bearing

The BPW ECO Unit, tried and proven a million times over in its ECO^{Plus} design, has been replaced by the still further improved, new ECO Plus 2 design.

A consistent optimisation of the components has resulted in a significant weight reduction compared with the current ECO^{Plus} Unit.

In the case of the ECO Plus 2 the hub cap has a bayonet lock, enabling comfortable assembly and disassembly of the hub cap.

Grease is supplied to the wheel bearings by means of a grease cartridge located between the bearing points.

The axle nut previously used is replaced by an axle bolt with integrated torque limiter.

Fig. ECO Plus 2 (8 - 9 t)

ECO Plus 2 bearing - Features and benefits

- ⊙ The encapsulated bearing unit (ECO Unit) requires no maintenance and has an integrated multi-seal system to protect the roller bearings from dust and dirt
- ⊙ Integrated torque limitation of the axle bolt prevents wrong usage during tightening
- ⊙ Bearings are precisely re-adjusted after every disc replacement
- ⊙ 5+3 years ECO Plus warranty (on-road) without mileage limit
- ⊙ Compact bearing system with DIN-ISO roller bearings available worldwide for excellent availability and rapid service
- ⊙ Removal of the complete hub unit - thanks to central bolt - with simple tools
- ⊙ Simple lubrication of the bearing by means of a grease cartridge
- ⊙ Excellent bearing service life with minimal life cycle costs
- ⊙ In conjunction with the revised air suspension system there are significant weight savings up to 25 kg depending on the axle type
- ⊙ Existing approvals and homologations remain in force

Fig. ECO Plus 2 (8 - 9 t)

4 Hubs, hub bearings

General

ECO Plus 2

Hub cap/ECOMETER

BPW trailer axles with the ECO Plus 2 bearing have hub caps (and ECOMETER) with a bayonet lock.

The bayonet lock replaces the previously usual threaded connection.

An installation spanner with SW 120 (BPW item number 03.339.05.02.0, see also BPW tool catalogue) is needed for assembly or disassembly of the new hub caps with the bayonet lock.

 **An impact driver must not be used for assembly/disassembly of hub caps or ECOMETERS with a bayonet lock!**

Removal

For removal, the hub cap is turned counterclockwise approx. 30° with the installation spanner (Fig.).

When turned further, the hub cap lifts clearly away from the hub seat.

The released position is also indicated by markings on the hub cap and on the wheel hub (Fig. / arrows).

In the released position the hub cap can be removed axially from the wheel hub.

Assembly

The seal between the hub cap and the wheel hub takes the form of an O-ring in the case of the ECO Plus 2 unit.

The O-ring is inserted in the groove on the neck of the wheel hub and is to be replaced at every assembly. The hub cap itself is to be given a thin coating of ECO-Li^{Plus} BPW special longlife grease inside in the area of the bayonet lock, before assembly.

Corresponding markings in the hub cap and on the hub make it easier to assemble the hub cap.

The figure shows the hub cap in the correct position for fitting, with the spanner engaged.

After being placed in position, the hub cap is axially pressed onto the hub and at the same time turned in clockwise direction. The hub cap is tightly seated when the position shown in Fig. (arrows) has been reached.

Hubs, hub bearings 4

General

Hub seal for ECO^{Plus} bearings

The innovative ECO^{Seal} sealing system is used on all axles with the BPW ECO Disc disc brake.

With this hub seal, the primary seal lip (ECO^{Seal}) no longer seals directly against the sealing partner (bearing race of the hub) but instead against a bearing race which is integrated in the seal itself.

This new design has made it possible to significantly reduce the circumferential speed of the seal and thus wear. In addition, the wheel bearing is provided with even better protection against dirt penetration by means of the covering dust and dirt sealing lips.

Advantages:

- ⊙ An introversive pre-stressed main seal lip with a low circumferential speed and a low thermal load, resulting in low wear
- ⊙ An approximately 30 % reduction in frictional resistance inside the seal (compared with conventional seals)
- ⊙ The seal is well protected during service due to the cartridge construction
- ⊙ Pretensioned main sealing lip with venting function, no opening with negative pressure
- ⊙ No dirt seal necessary

Fig. ECO Plus 2 + ECO Plus 3 (8 - 9 t)

Fig. ECO^{Plus} (10 - 12 t)

4 Hubs, hub bearings

General

BPW hub bearings ECO Plus 3 bearing

Starting from the special BPW ECO Plus 2 hub system, the ECO Unit was further developed and resulted in the ECO Plus 3 bearing.

The hub requires no maintenance and has an integrated multi-seal system to protect the roller bearings against dust and dirt.

With the ECO Plus 3, the hub cap has a screw connection (M 135 x 2 / SW 110), which allows comfortable assembly and disassembly of the hub cap.

The tightening torque of the hub cap is 350 Nm.

An O-ring inserted between wheel hub and hub cap guarantees sealing against moisture and dirt.

Grease is supplied to the wheel bearings by means of a grease cartridge located between the bearing points.

A central bolt with integrated torque limiting function ensures the bearing preload is always optimal.

ECO Plus 3 bearing - Features and benefits

- ⦿ The encapsulated bearing unit (ECO Unit) requires no maintenance and has an integrated multi-seal system to protect the roller bearings from dust and dirt
- ⦿ Integrated torque limiting function of the axle nuts (ECO Plus 3) prevents wrong usage during tightening
- ⦿ Bearings are precisely re-adjusted after every disc replacement
- ⦿ 5+3 years ECO Plus warranty (on-road) without mileage limit
- ⦿ Compact bearing system with DIN-ISO roller bearings available worldwide for excellent availability and rapid service
- ⦿ Removal of the complete hub unit - thanks to central bolt - with simple tools
- ⦿ Simple lubrication of the bearing by means of a grease cartridge
- ⦿ Excellent bearing service life with minimal life cycle costs
- ⦿ Existing approvals and homologations remain in force

Hubs, hub bearings 4

Grease filling, bearing adjustment 4.6

ECO^{Plus} hub system (ECO^{Plus} Unit)

Grease filling

ECO^{Plus} hub system (ECO^{Plus} Unit)

The ECO^{Plus} hub system is designed for longlife lubrication. On expiry of the guarantee, the roller bearings, the inside of the hub and the seals must be thoroughly cleaned (with diesel oil), dried, checked to see if they can be re-used, and regreased every 3 years when used off-road, or every 5 years when used on the road within Europe (or every year when off-road and every 2 years when on the road outside of Europe) (observe the current BPW maintenance instructions).

Use a microfibre cloth to clean the bearing seats of the axle stub (metal must be bright, dry and free of grease) and apply **Castrol White T** thinly all around using a microfleece brush.

		BPW special longlife grease ECO-Li ^{Plus} , quantity of grease per roller bearing			
		① inner		② outer	
Axle load	Axle type	Roller bearings	Quantity of grease	Roller bearings	Quantity of grease
10000 - 12000 kg	SH.. 10 - 12 t ECO ^{Plus}	33118	170 g	33213	120 g
	SK.. 10 - 12 t ECO ^{Plus}		130 g *		90 g *

- ① + Work **BPW special longlife grease ECO-Li^{Plus}** thoroughly into the spaces between the tapered rollers and the races, and apply the remaining amount in the bearing outer ring of the hub.
- ②

* Lubrication with grease spray see page 48.

For other procedures see the current maintenance instructions.

Bearing adjustment

ECO^{Plus} hub system (ECO^{Plus} Unit)

1. Unscrew the hub cap.
2. Remove the hooked spring ring with a wedge from the axle nut.
3. Tighten the axle nut while turning the wheel hub at the same time with a hexagon spanner until the tothing of the axle nut clicks round. Repair guide! Do not use an impact tool.
4. Fit the retaining key in the groove between the axle stub and the nut (do not reset the axle nut).
5. Insert the hooked spring ring behind the formed edge of the axle nut or into the thread on the axle stub, depending on the design.
6. Screw on the hub cap and tighten it to 800 Nm.

BPW special longlife grease ECO Li ^{Plus}	Container	BPW code no.
	0.4 kg cartridge	02.1040.45.00
	5 kg bucket	02.1040.47.00
	25 kg bucket	02.1040.49.00
	50 kg barrel	02.1040.50.00

4 Hubs, hub bearings

4.7 Grease filling, bearing adjustment

ECO Plus 2 hub bearing (ECO Plus 2 Unit)

Grease filling

ECO Plus 2 hub system (ECO Plus 2 Unit)

The ECO Plus 2 Unit is designed for longlife lubrication. On expiry of the guarantee, the roller bearings, the inside of the hub and the seals must be thoroughly cleaned (with diesel oil), dried, checked to see if they can be re-used, and regreased every 3 years when used off-road, or every 5 years when used on the road within Europe (or every year when off-road and every 2 years when on the road outside of Europe) (observe the current BPW maintenance instructions).

Use a microfibre cloth to clean the bearing seats of the axle stub (metal must be bright, dry and free of grease) and apply **Castrol White T** thinly all around using a microfleece brush.

		BPW special longlife grease ECO-LI ^{Plus} , Quantity of grease per roller bearing			
		① inner		② outer	
Axle load	Axle type	Roller bearings	Quantity of grease	Roller bearings	Quantity of grease
8000 - 9000 kg	SH.. 8 - 9 t ECO Plus 2 SK.. 8 - 9 t ECO Plus 2	33118	130 g	33213	90 g

- ① Clean the grease cartridge and fill it up to the edge on both sides with **BPW special longlife grease ECO-LI^{Plus}**.
 ② Apply a ring-shaped bead of grease to the running surfaces of the bearing outer rings.

For other procedures see the current maintenance instructions.

When BPW grease sprays are used there is no need to fill the grease cartridge or to apply the bead of grease.

For lubrication with grease spray see page 48.

Bearing adjustment

ECO Plus 2 hub system (ECO Plus 2 Unit)

- Undo the hub cap by turning it approx. 30° in a counterclockwise direction (see page 40).
When turned slightly further the hub cap lifts clearly away from the ECO Unit and can be removed by pulling it away axially.
- Remove the hooked spring ring and retaining key from the axle bolt.
- Tighten the axle bolt while at the same time turning the ECO Unit with a hexagon spanner (SW 46) until the tothing of the axle bolt clicks round.
Attention! Do not use an impact tool.
- Insert the locking piece into the recess of the axle bolt and into the tothing of the toothed washer
(Do not turn back the axle bolt).
- Insert the hooked spring ring into the groove at the end of the hexagon profile of the axle bolt.
- Insert a new O-ring into the groove in the wheel hub.
- Apply a thin layer of **BPW special longlife grease ECO-LI^{Plus}** to the hub cap in the area of the O-ring contact surface and the bayonet lock.
- Put the hub cap on (position 1, page 40). Use the 120 mm hub cap spanner to lock the hub cap in place by turning approx. 30° in a clockwise direction, while at the same time pressing on the hub cap axially.
Has a tight seat when it reaches position 2 (page 40).

Repair guide! Do not use an impact driver- bayonet lock.

Hubs, hub bearings 4

Grease filling, bearing adjustment 4.8

ECO Plus 3 hub system (ECO Plus 3 Unit)

Grease filling

ECO Plus 3 hub system (ECO Plus 3 Unit)

The ECO Plus 3 hub system is designed for the use of longlife lubrication. On expiry of the guarantee, the roller bearings, the inside of the hub and the seals must be thoroughly cleaned (with diesel oil), dried, checked to see if they can be re-used, and regreased every 3 years when used off-road, or every 5 years when used on the road within Europe (or every year when off-road and every 2 years when on the road outside of Europe) (observe the current BPW maintenance instructions).

Use a microfibre cloth to clean the bearing seats of the axle stub (metal must be bright, dry and free of grease) and apply **Castrol White T** thinly all around using a microfleece brush.

		BPW special longlife grease ECO-Li ^{Plus} , quantity of grease per roller bearing			
		① inner		② outer	
Axle load	Axle type	Roller bearings	Quantity of grease	Roller bearings	Quantity of grease
8000 - 9000 kg	SR../SKR.. 9 t ECO Plus 3 SH../SKH.. 8 - 9 t ECO Plus 3	33118	170 g 130 g *	33213	120 g 90 g *

- ① Work **BPW special longlife grease ECO-Li^{Plus}** thoroughly into the spaces between the tapered rollers and the races, and apply the remaining amount in the bearing outer ring of the hub.
- ②

* Lubrication with grease spray see page 48.

For other procedures see the current maintenance instructions.

Bearing adjustment

ECO Plus 3 hub system (ECO Plus 3 Unit)

1. Unscrew the hub cap.
2. Remove the hooked spring ring with a wedge from the axle nut.
3. Tighten the axle nut while turning the wheel hub at the same time with a hexagon spanner until the tothing of the axle nut clicks round. Repair guide! Do not use an impact tool.
4. Fit the retaining key in the groove between the axle stub and the nut (do not reset the axle nut).
5. Insert the hooked spring ring behind the formed edge of the axle nut or into the thread on the axle stub, depending on the design.
6. Insert a new O-ring into the groove in the wheel hub.
7. Screw on the hub cap and tighten it to 350 Nm.

5 ABS

General

ABS

In the anti-lock brake system (ABS), the wheel movement is recorded using a proximity-type arrangement with an exciter ring attached to the hub and a sensor (speed sensor) that generates the pulses.

The wheel speed is continuously reported to the central control electronics from each wheel in this way. It has a complex program for processing the received information about the movement behaviour of the wheel and for calculating and logically linking the control signals. Using the pressure control valves assigned to each wheel, it adjusts the air pressure and therefore the braking of each individual wheel (depending on the ABS system).

Almost all BPW axles can be retrofitted with ABS without any problem. Simply attach the exciter rings, sensor brackets, sensors and attachment parts included in the supplementary installation kit to the axle according to the supplied mounting drawing and connect them to the vehicle electronics.

ABS 5

General

Attachment of the sensor support

Various sensor attachments are used, depending on the axle design.

- ⊙ Sensor attachment on the brake anchor without any additional components

- ⊙ Bolted sensor attachment on the axle beam / steering pivot assembly

6 Wheel studs

General

BPW wheel studs

The wheel brace (or wheel disc) connects the rim with the wheel hub and must absorb the high, lateral and longitudinal forces that occur and transmit them to the wheel hub via the wheel studs (wheel screws).

BPW axles with disc brakes are suitable for wheels with either stud or spigot alignment, and with a few exceptions they are all supplied with helical fit wheel bolts.

Helical studs are easy to maintain and connect the brake disc to the hub using a pressfit. As a result, there is no need for internal nuts.

The hub bore is not damaged even after several removal/fitting operations (in contrast to splined bolts) and the clamping forces for the wheel studs remain constant.

The prescribed BPW tightening torques for wheel fastening are listed in the current BPW maintenance instructions and must be observed.

Assembly of the wheel studs

The helical fit wheel bolt is inserted from the rear through the hole in the brake disc / hub.

Then a sleeve is pushed over it, a wheel nut is applied and the wheel stud is drawn into its final position.

 **It is important to ensure that the flattened head of the wheel bolt sits correctly!**

Wheel stud 6

General

Wheel stud alignment

In stud alignment, the wheel brace (with countersunk stud holes) is centred using wheel studs with (spring) centring rings.

Spigot alignment

In spigot alignment, the wheel brace is centred using a centring spigot or ring surfaces on the wheel hub.

Centring bushes may be mounted on two opposing wheel studs of each hub in the case of wheels with spigot alignment. This is not necessary, however.

Centring bushes must be mounted on two opposing wheel studs of each hub in the case of wheels with mixed centring.

Alloy wheels

In the case of alloy wheels, the wheel brace is centred using a centring cam or ring surfaces on the wheel hub. As the flange thickness is greater with alloy wheels than with steel wheels, it is important to check whether the axles are suitable for fitting alloy wheels (with 26 mm-diameter hole).

In the case of twin wheels the available centring seat and wheel studs must be of adequate length (i.e. the thread of the wheel nut must be completely engaged with the wheel bolt thread).

If not, alloy wheels with stud hole $\text{Ø } 32$ can be used in conjunction with shaft nuts without replacing the hub or the wheel studs.

(The wheel is not centred by the shaft nuts.)

6 Wheel studs

7 Accessories

7.1 Steering dampers, general

BPW steering dampers

For BPW-Tag axles, ..LL series, there are various steering damper parts kits.

A steering damper is absolutely essential under the following operating conditions:

- ⦿ Where the ratio of the number of rigid axles to steering axles is 1:1 (2:2)
- ⦿ Where an axle lift is used in the tri-axle suspension
- ⦿ Where steering axle king pin bearings are connected to a central lubrication system

The steering damper is easy to assemble and retrofit. Assembly is carried out exclusively by means of screws (no welding).

The necessary attachment holes are present on the steering axles. Each parts kit also includes an installation drawing.

Hub caps with integrated digital odometer (ECOMETER) 7.3

The BPW hub cap with its integrated digital odometer is an important instrument for checking the mileage of your drawbar trailer or semi-trailer. This means you can always track the real trailer mileage, especially in case of alternating motor vehicles.

The digital ECO meter can be used universally for all tyre sizes.

The adjustment of the wheel size is carried out by means of the display unit (basic setting 385/65 R 22.5).

A minicomputer that is protected from water and dirt counts the wheel revolutions using a magnet and a reed contact.

The digital ECOMETER with the special hooked spring ring and integrated magnet is available for all BPW ECO-Plus axles with an M 136 x 2.5 hub cap thread, as well as ECO Plus 2 axles with a bayonet lock.

¹⁾ Not resistant to corrosion acc. to DIN EN ISO 9227

Further information see service and installation instruction "Digital ECOMETER" - BPW No.: 04.001.21.24.0 (ECO^{Plus}) and 04.001.21.25.0 (ECO Plus 2).

7 Accessories

7.4 Tools, general

BPW special tools and measuring devices

Special tools and measuring devices have a long tradition at BPW Bergische Achsen KG and are based on decades of experience.

The existing range of tools has been systematically improved with each new generation of axles and expanded by new products.

For the maintenance and repair of its ECO Disc TS2/TSB disc brake, BPW offers a new **tool case (BPW code no. 99.00.000.9.72)** that keeps all the tools that may be required to hand.

For an existing tool case TSB, BPW offers a **supplemental set (BPW item no. 09.801.08.82.0)** which contains all additional tools for the TS2.

In addition, BPW offers special measuring devices for checking dimensions on axles and suspensions (toe-in, toe-out etc.).

Version

Tools must prove their worth in hard, everyday use. Only then does it become clear whether tools are up to the demands of the real world.

Use of high-quality materials

Top quality materials are the key to high quality tools. Continuous quality assurance guarantees consistent quality.

Favourable cost-performance ratio

Quality is not always obvious at first glance (e.g. materials).

Buying quality tools is often the better-value solution in the long run. This is the case especially whenever tools are required on a regular basis and trouble-free use has to be ensured at all times.

- ⊙ The special tools guarantee that all recommended service work on the BPW ECO Disc (TS2 3709 / 4309 as well as TSB 3709 / 4309 / 4312) can be performed safely and easily.
- ⊙ All work on the vehicle is only allowed to be performed by employees of the commercial vehicle industry and the commercial vehicle trade who have the appropriate technical proficiency. Always follow the safety instructions issued by the vehicle manufacturer.
- ⊙ Observe the BPW workshop manual (www.bpw.de).

Long-life, low wear

BPW tools are designed to be particularly resistant to wear and tear, and guarantee an extremely long service life, even with frequent use.

Easy to handle

The best solutions are always the simplest ones. This statement also particularly applies to tools.

This is the reason why BPW tools are geared specifically to meet technical requirements.

Solutions that do not meet practical requirements are rigorously weeded out at the development stage.

Details on the correct use of the tools can be found in the respective workshop manuals.

For more tools see the BPW tools catalogue.

BPW is a globally leading manufacturer of intelligent running gear systems for trailers and semi-trailers. As an international mobility and system partner, we offer a wide range of solutions for the transport industry from a single source, from axle to suspension and brake to user-friendly telematics applications.

We thereby ensure outstanding transparency in loading and transport processes and facilitate efficient fleet management. Today, the well-established brand represents an international corporation with a wide product and service portfolio for the commercial vehicle industry. Offering running gear systems, telematics, lighting systems, composite solutions and trailer superstructures, BPW is the right system partner for automotive manufacturers.

BPW, the owner-operated company, consistently pursues one target: To always give you exactly the solution which will pay off. To this end, we focus our attention on uncompromising quality for high reliability and service life, weight and time-saving concepts for low operating and maintenance costs as well as personal customer service and a close-knit service network for quick and direct support. You can be sure that with your international mobility partner BPW, you always use the most efficient method.

Your partner on the way to economic viability!
